

# **System configurations and diagrams**

Controller block diagrams and cable connections

# DM5100F controller block diagram

# DM5100F switchless clustering

D5100F systems require two 25 GbE cluster interconnections.

## Cluster & HA interconnects (blue lines)

- Connect ports e0c and e0c
- Connect ports e0d and e0d

# DM5100F switched clustering

DM5100F systems require two 25 GbE cluster interconnections.

- Use 25 GbE cables to connect the controllers to the SFP28 switch ports
- Each switch should have one connection to each controller

## Cluster interconnections

### Switch 1

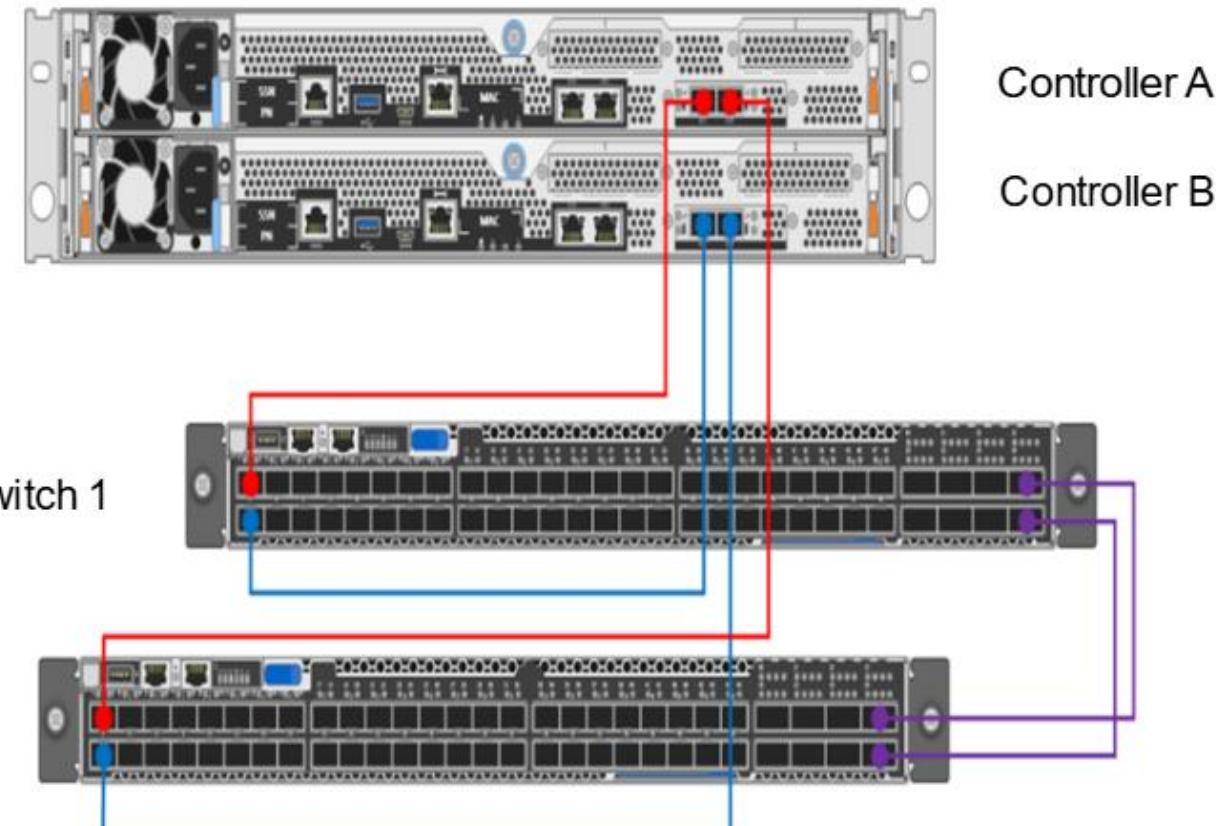

- Controller A: e0c (red lines)
- Controller B: e0c (blue lines)

### Switch 2

- Controller A: e0d (red lines)
- Controller B: e0d (blue lines)

The following switches are supported:

- Lenovo BES-53248
- Cisco Nexus 3232C

**Note:** If the user has a 10 GbE switch for clustering, an additional 10 GbE adapter will be required.

# Cabling a DM5100F to a DM240N expansion enclosure

The DM240N (7Y62) is the only supported expansion enclosure.

Two 100 GbE connections are required for each controller.

Install a 100 GbE mezzanine card in slot 1 in each controller and connect each controller to each expansion enclosure module.

## Controller A (blue lines):

- Connect port e1a to port e0a on NSMA
- Connect port e1b to port e0b on NSM B

## Controller B (red lines):

- Connect port e1a to port e0a on NSM B
- Connect port e1b to port e0b on NSMA
